To access the GitHub repository for this case study see here: https://github.com//opencasestudies/ocs-bp-co2-emissions. This case study is part of a series of public health case studies for the Bloomberg American Health Initiative.

Please help us by filling out our survey.

Open Case Study Survey

We are collecting data about user experience with our case studies to learn more about how to improve the data science education experience. Part of this includes getting a better understanding of who is using our case studies and how so that we can better design our case studies. This data may ultimately be used for a research publication. We thank you very much for any feedback you can provide!

DATA CONFIDENTIALITY: We will not collect any personally identifiable information about you through this survey for the purposes of this research. We will only ask very general questions about you (such as if you are a student) and your use of the case studies. The potential risks to you are small. The potential benefits to the community of data scientists, developers, and professors are very high – we will be able to learn how we can improve data science/statistics/public health education material.

DATA SHARING: We plan to release the data collected from this survey openly online using GitHub (https://github.com/) - however no personally identifiable information (such as email addresses) will be shared as it will not be collected. See below for an image of what the data might look like. We will only have a timestamp and answers to your questions. Only a reduced version of the timestamp will be included in the shared data to enhance the anonymity of the participants.
